Medical Report

Patient Age: 8 years girl

Medical History:

The patient had a high fever in October 2025. Two to three days after the fever, he started to lose hearing in both ears. At first, he received treatment from local doctors. Later, he was taken to Pakistan for further examination. An ENT specialist examined him, prescribed medicine, and said that his hearing might recover within six months.

Unfortunately, during those six months, the patient's hearing became completely lost.

After that, he was examined by two more ENT specialists. All of them agreed that the patient is a candidate for a Cochlear Implant and needs cochlear implant surgery to restore his hearing.

During the treatment in Pakistan, the patient and his father were deported because they did not have legal documents. They returned to Afghanistan and continued treatment there. The ENT specialists in Afghanistan have also recommended a cochlear implant.

Current Condition:

- Complete or severe hearing loss in both ears.

- Unable to hear speech.

- Frequent crying and sadness because of hearing loss.

- Emotional distress.

- Poor appetite and weight loss.

- Difficulty communicating with others and performing daily activities.

Doctors' Recommendation

According to the evaluation of several ENT specialists, the patient needs Cochlear Implant Surgery.

The cochlear implant device costs about USD 24,000, not including the cost of surgery, hospital care, and other medical expenses.

The patient's family has serious financial difficulties and cannot afford the cost of the treatment. They kindly request the specialist's medical advice and any possible assistance for the patient's treatment.

So let me an appointment to talk face to face if possible.

Thanks for your time Habib 0471898264
